

9/10 ch.1.1

Turing Model

Von Neumann Model: Store program and data in the same memory
Vs. Turing Model: Only data is stored in memory, but you should change programs if you want different output.

Figure 1.5 The Von Neumann model

Memory: Storage area where data and program is stored during processing.

Arithmetic logic unit (ALU), 算數邏輯單元: Doing calculate and logic operation including arithmetic operations and logic operations

Control Unit: Control operation of ALU, Memory and I/O.

Input/Output: The input subsystem accepts input data and the program from outside the computer, while the output subsystem send the result of processing to the outside world.

* A program in Von Neumann model executing by following the sequential execution of instructions. The control unit fetches the instruction from memory, decodes it, then execution it
